

# For product developers

From idea to functional plastic component

## Functional plastic component

When you know how important it is that a component works – and we know how to help you get there. At Pla-Mek® you will meet professionals who understand both design and production, and who can contribute with insight and optimization early in the development process. Here you will find an overview of what we need from you to get started, and how we work to ensure that the solution is both functional, cost-effective and production-ready.

**We know that function and quality are crucial – and it starts with good drawing materials.  
To get started, we need:**

### **3D model**

- Delivered in agreed CAD format (contact us for which ones we support)

### **2D drawing and requirements specification**

- Feel free to use our own checklist, which can be downloaded here:

Note: The component must be designed for the chosen plastic material and injection moulding. We can assist with this – and we recommend getting involved early in the development process to ensure optimal solutions.

Please contact us to receive our requirements checklist.
